[OGRS'16](#), October 12-14, 2016,  
[Perugia](#), Italy

*Open Source Geospatial Research & Education Symposium*  
OGRS is a meeting dedicated to sharing knowledge, new solutions, methods, practices, ideas and trends in the field of geospatial information through the development and the use of free and open source software in both research and education.

# Background

- Social media data become a powerful **real time informative source** to monitor the impacts of **meteoclimatic events**.
- The reliability of **social media activity and content** on weather related **natural risk** is a current topic.
- Weather events are bounded in time and space and could have a deep impact on civil society
- Performing real-time events detection from social media sources requires tools and a cross-disciplinary framework.
- Methods to detect and track natural hazards by using public informative continue to increase in coverage, resolution and reliability.

*River of Words* is a project by writer Israel Centeno and visual artists Carolina Arnal and Gisela Romero Pittsburg

# Aims of work

- Report a 4 year experience on analysis of Twitter **social media (SM) streams** related to weather.
- Share background needed for an effective information extraction from public SM flows paying attention to a fast and real detection of impacting weather events in order to increase situational awareness.
- Showing some empirical evidences to help implement a real open toolchain leading to a visual dashboard for regional/national weather services.

Met Office ha ritwittato

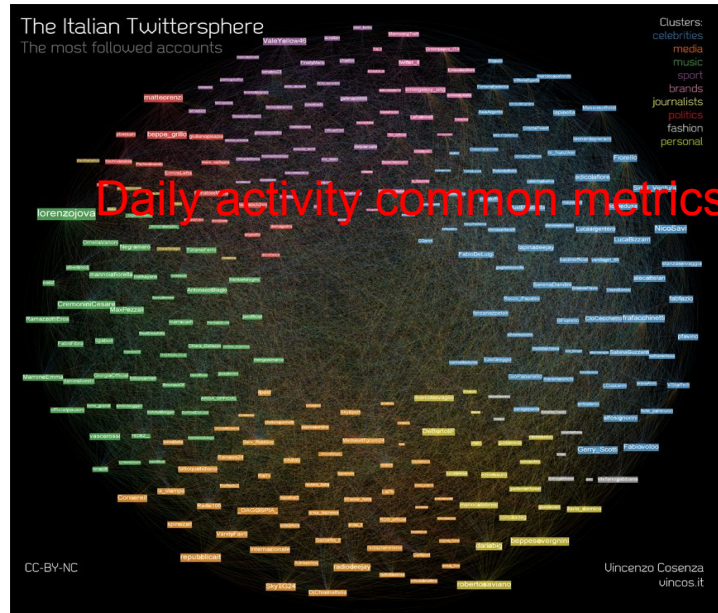

**Met Office Storms** @metofficestorms · 59 min

The eye and strongest winds of **#Hurricane #Matthew** moving perilously close to the **#Florida** coast. Peak winds 120 mph around the eyewall.

# Social Media Public Sources: crowd-sensing by using Twitter data

On-line multilanguage platform for social-networking and microblogging.  
Twitter data perform significant crowd-sensing.

**6.4 million** of active users in Italy (2015)

Daily activity common metrics

Who feed information in  ?

Many and various

Citizen, Institution, Institutional Public Services, Business Companies, Community - NGO organization, Media, Conversational Bots and Sensors Bots.

Metrics of activity

**RTW\_TW**: N° of tweets & retweets

**RTW**: N° of tweets & retweets

**TW**: N of native tweets & retweets

**U\_native\_users**: N° of native TW authors

**U\_full\_user**: N° authors of TW & RTW

**U\_unique\_hashtag**: N° of hash-TAG

# DATA EXTRACTION by word query : the Twitter Vigilance DISIT Model

<http://www.disit.org/tv/>

Twitter Vigilance platform is an environment developed by DISIT University of Florence that:

- Manage multiple queries in twitter API
- Store the data of messages collected by user defined queries -> channel
- It is a dashboard able to visualize data collecting process & analytics of twitter metrics of channel

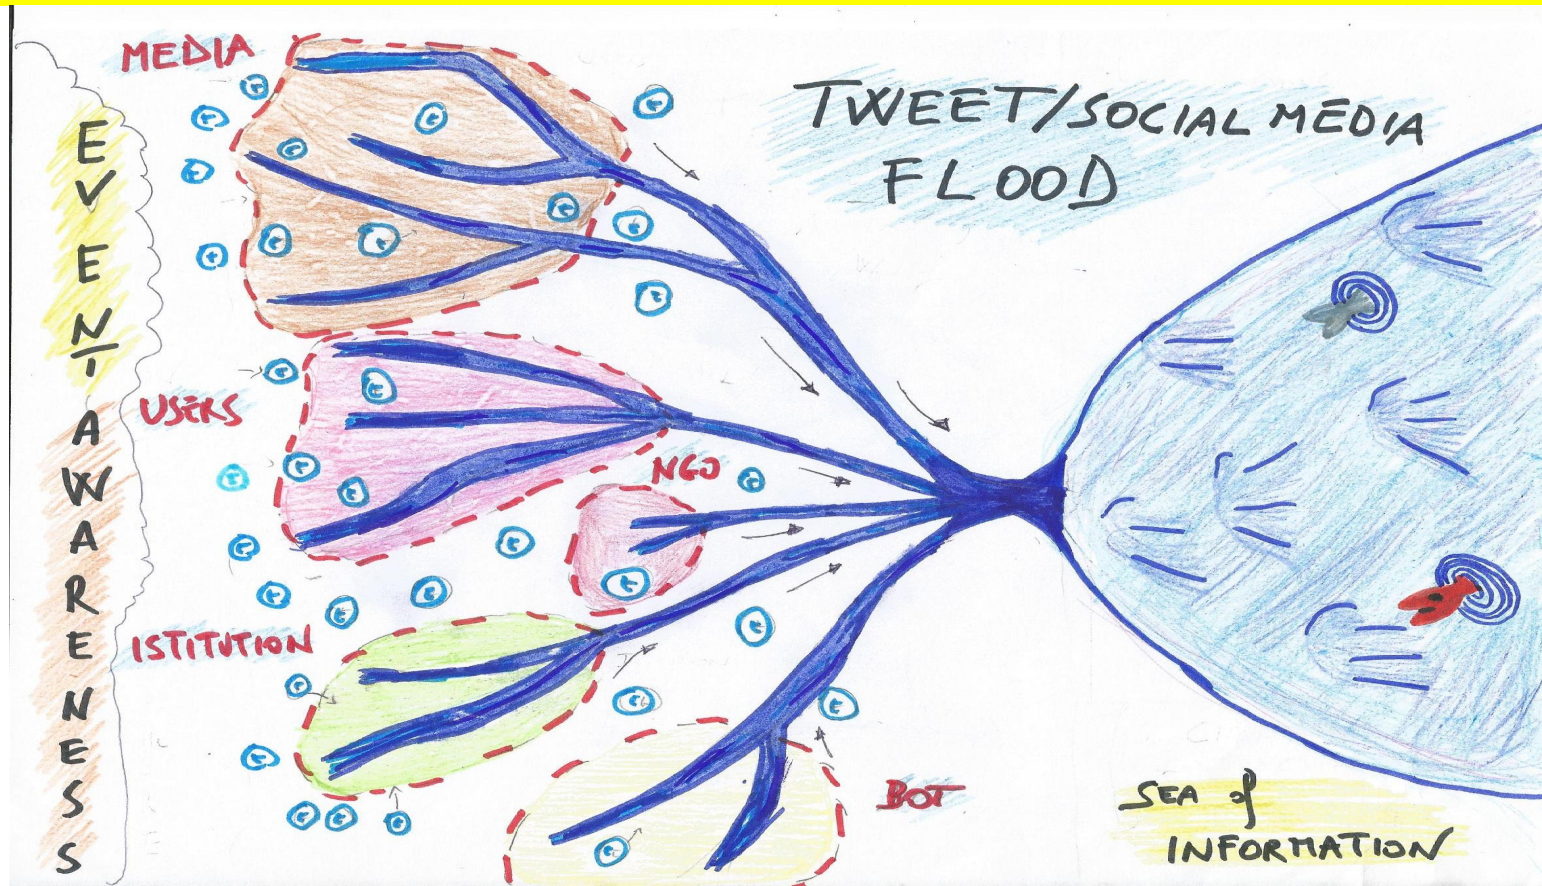

Social media data: Channel “CALDO”

[http://www.disit.org/tv/index.php?p=chart\\_singlechannel&canale=CALDO](http://www.disit.org/tv/index.php?p=chart_singlechannel&canale=CALDO)

Channel	Related research	Total ▾	N° tweets	N° tweets(%)	N° retweets	N° retweets(%)	Details	Analysis
CALDO	#caldo #sole afa allerta allerta caldo anticiclone caldissimo caldo canicola disagio caldo emergenza caldo estate rovente fleggetonte ondata di calore rischio rovente temperature torrido	3344111	1851650	55.37%	1492461	44.63%	From 2009-10-23 To today	From 2015-05-15 To2015-09-15

EVENT DETECTION in social media: fishing words/tags in a FLOOD of in dropped messages

## EVENT DETECTION in social media: words/tags creates “word drainage” channels

Different queries correspond to different data extraction volumes.

Each one can be summarized as daily statistics by using key activity metric and obtaining different representable flows in function of the querying parameters (terms, hashtags (#) or users (@)).

## DATA EXTRACTION : Twitter corpora have the highest lexical diversity

	WIKIPEDIA	TWITTER	BOOKS	WEB
SIZE (ratios)	1 X	~1.2 X	~100 X	~200 X
LEXICAL DIVERSITY	483 k	736 k	135 k	206 k
CURATION	Very High, Peer Reviewed, Updated Frequently	None. High rate of typos and non standard language	Professionally edited.	Mix
REGISTER	Very Formal, Reporting Fashion	Very Informal, Colloquial	Formal, Narrative style	Mix
OBJECTIVITY	Completely Factual	More Opinions	More Fictional	More factual

Twitter shows many OOV out-of-vocabulary terms that change in function of the events.

Considering specific features of Twitter textual data it is ever hard to mine conversations.

[Modeling Word Meaning: Distributional Semantics and the Corpus Quality-Quantity Trade-Off](#)

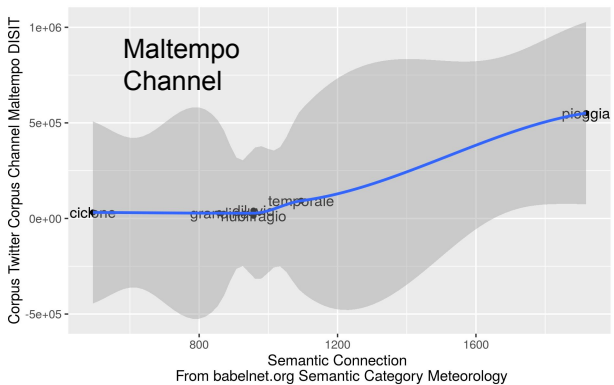

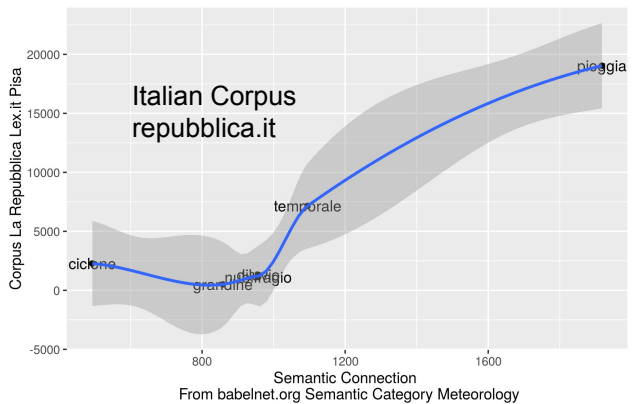

S Sridharan, B Murphy

Proceedings of the 24th International Conference on Computational Linguistics

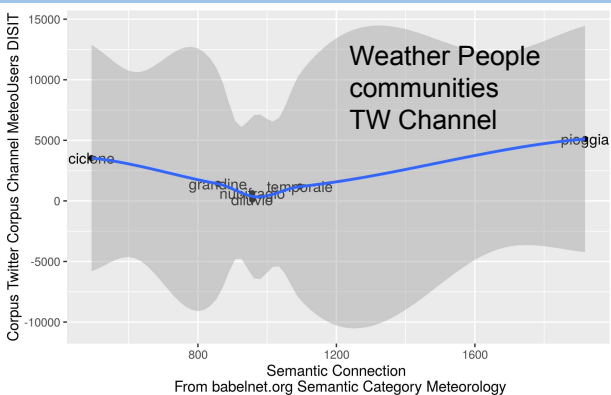

# DATA EXTRACTION : Terms of channel have different extractive capabilities

More “crowd” corpora

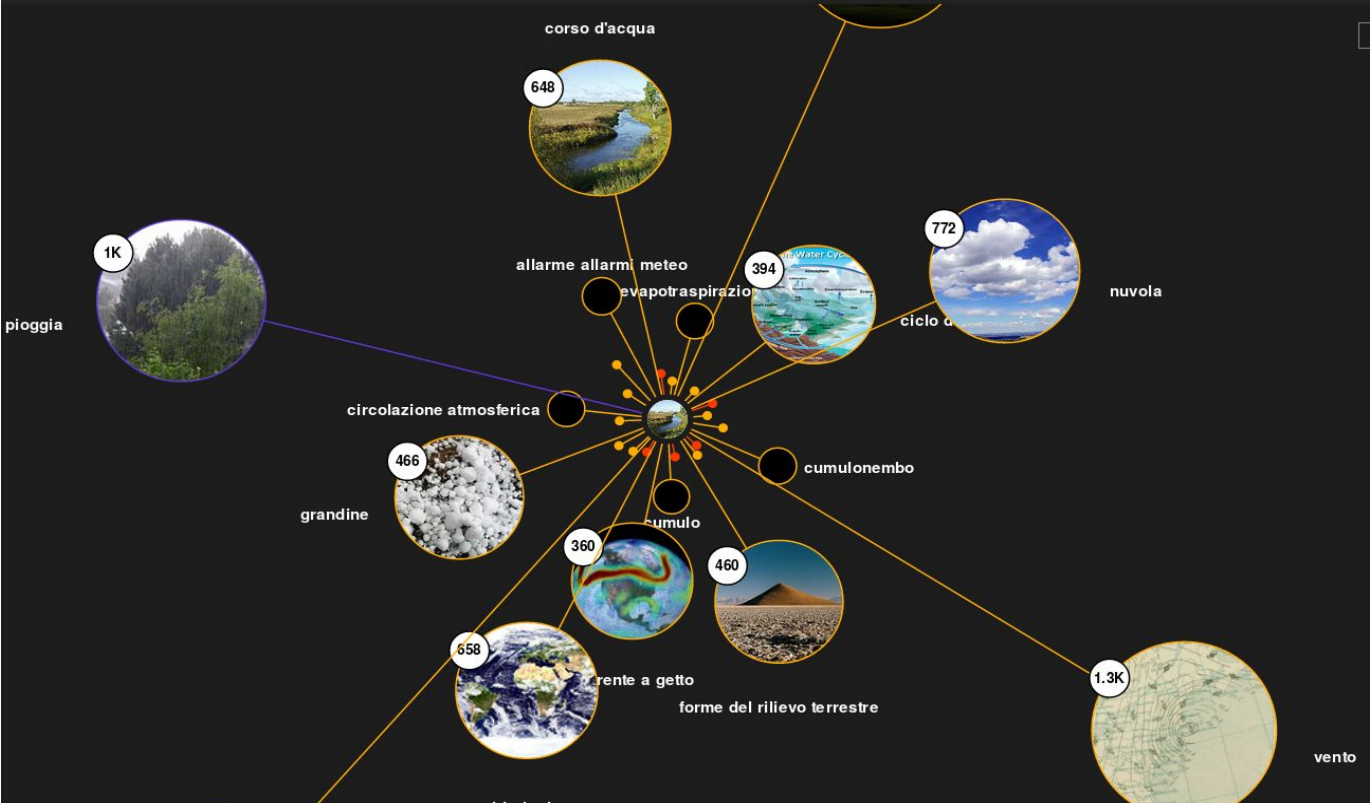

More “oriented community based”

Semantic capabilities ( N of connection) of words are different and their power of extraction in the Twitter streams differs in function to Users sets. In popular streams wide sense words seems also high frequency words and are able extract more messages.

Babelnet.org metrics are used for meteorology category.

# Semantic network of word sense: word “PIOGGIA” from Babelnet.org

# EVENT IDENTIFICATION: Social media and real-world event condition for linking

Identification and  
Characterization of Events in  
Social Media

Hila Becker  
Thesis  
Columbia University 2011

[http://www.cs.columbia.edu/~hila/  
publications.html](http://www.cs.columbia.edu/~hila/publications.html)

- **Document stream:** a time ordered sequences of featured documents  $D_{ev}$
- **Trending time:** a trending time period for a feature over a document stream is time period where document frequency of the features in document stream is substantially higher than expected.
- **Trending event :** is a real-world occurrence with an (1) *associated time* ( $T_{ev}$ ), (2) a *stream document* ( $D_{ev}$ ) about the occurrence and published during  $T_{ev}$  and (3) one or more features that describes the occurrence and for which  $T_{ev}$  is trending time period over document stream ( $D_{ev}$ ).

## EVENT DETECTION in social media: what is a Twitter channel?

- Channel is a conversation stream obtained by a recursive API query of tweets (Twitter API 1.1)
- Channel produces a dataset with a time dimension.
- Channel has a set of contributors (original unique authors or amplifiers by re-tweet mechanism).
- Channel is a virtual conversational space among different communities.
- Channel is a textual corpus with specific linguistic and semantic properties.
- Channel has proper activity dynamics and behaviours regarding social media mechanisms (retweeting, mentioning, tagging, media and linking content)
- Channel could be representative of a specific web-community or not.
- Semantic oriented channels could represent a set of topic specific informations.

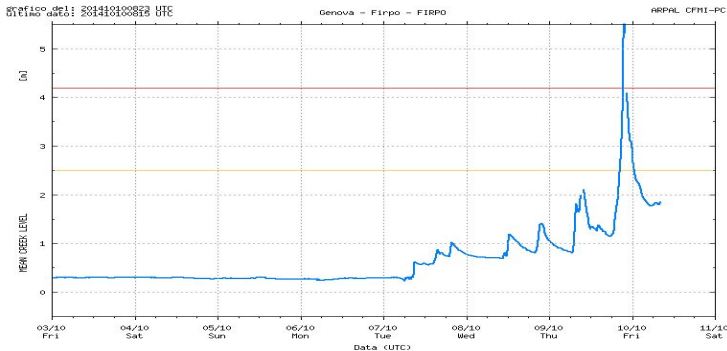

## EVENT DETECTION. Social media and real-world event: conditions for their link.

As a flood needs rain, in social media real-impact events needs documents.

Quantitative relation relies on some factors:

- Population density of the area impacted
- Level of awareness of people involved
- Digital literacy of impacted population
- Institutional preparedness to weather related risks

# EVENT DETECTION : 12-08-2015 Twitter channels for Rossano (Calabria) flood event

# Channel “Caldo” and Heatwave periods 2015 (15 May to 15 September)

# Framing conjectures for detection of weather events

- For weather events that have a slow impact “trending periods” of SM activity work well.
- For the detection of fast and sudden events the synchronization of trending periods could be exploited by using search terms with different semantic extents.
- During synchronization time document frequency reach its relative maximum creating a well recognizable pattern and event is clearly detected (half onion effect).
- Geographical terms show their importance because are good proxy of event 's situational awareness.
- During severe events trending topics generally contain the name of the places involved.

<http://www.shutterstock.com/pic-86262523/stock-photo-a-red-onion-sliced-in-half-isolated-on-white-background.html>

# Conclusion

- Public & accessible social media data could be considered as a real huge informative data stream concerning severe weather events or other climatic threats.
- **Social media (SM)** data acquisition, storage and filtering to obtain reliable data collections requires huge work and dedicated tools. It is a real challenge for open source developers.
- Finding appropriate query-terms to obtain suitable data. The semantic tuning of **TW channels** is ever required. Platforms as **TwitterVigilance** are suitable example.
- Weather events are different in space, time and atmospheric processes involved. Events detection requires a specific search strategy. Appropriate use of semantic features of words point to interesting directions.

**LIVE** The earthquake in Italy: stereotyped narratives and missing social science

## About CARISMAND

- ✓ **Project Concept** - CARISMAND aims to deal with the issues of preparedness, response to disasters and after-crisis recovery which is inevitably influenced by cultural background...
- ✓ **Project Objectives** - Pursuing its goals towards culturally-informed solutions for disaster management...
- ✓ **Why is CARISMAND unique?** - CARISMAND comprehensively addresses a number of specific challenges and scope through a variety...
- ✓ **Who does CARISMAND concern?** - All CARISMAND activities are designed in such a way to be able to reach these
